

If purchasing a 1500 or 1700 BBQ as a built-in model, please note that the supplied gas hose is designed to run directly downwards beneath the BBQ and is not intended to be routed through the rear or sides of the unit.

There is limited clearance beneath the BBQ, and if the hose is forced to bend excessively, it may kink and restrict or completely cut off the gas supply.

When installing a built-in 1500 or 1700 BBQ, please ensure that the gas connection can be made directly underneath the appliance. If this is not possible within your installation, we strongly recommend adding a flexible gas hose to your order to allow for a safe and compliant connection.
